EXPERIMENT NO: 5

EXPERIMENT ON PACKET TOOL: WIRESHARK

AIM

To capture and analyze different types of packets using Wireshark.

5.1 TCP/UDP PACKETS

Aim: To filter and view TCP and UDP packets.

Filter used: tcp || udp

1. Start capture in Wireshark.
2. Open a website and apply the filter.
3. Select a packet and expand TCP/UDP details.
4. Stop and save the capture.

Result: TCP and UDP packets were filtered and inspected successfully.

5.2 ARP PACKETS

Aim: To filter and view ARP request and reply packets.

Filter used: arp

1. Clear the ARP cache using arp -d.
2. Start capture and ping the gateway.
3. Apply the filter arp and observe the request and reply.

Result: ARP request and reply packets were filtered and inspected successfully.

5.3 DNS PACKETS

Aim: To filter and view DNS query and response packets.

Filter used: dns

1. Start capture.
2. Run nslookup for a domain.
3. Apply the filter dns and observe the query and response.

Result: DNS packets were filtered and inspected successfully.

5.4 HTTP PACKETS

Aim: To filter and view HTTP request and response packets.

Filter used: http

1. Start capture.
2. Visit an HTTP website.
3. Apply the filter http and inspect the GET request and response.

Result: HTTP packets were filtered and inspected successfully.

5.5 ICMP PACKETS

Aim: To filter and view ICMP (ping) packets.

Filter used: icmp

1. Start capture.
2. Ping a host.
3. Apply the filter icmp and observe the echo request and reply.

Result: ICMP packets were filtered and inspected successfully.

RESULT

Various types of packets (TCP, UDP, ARP, DNS, HTTP and ICMP) were captured and analyzed successfully using Wireshark.
